

AI Posture Review

Findings from a two-week review of the model
delivery pipeline

AI Posture Review

What the review found, what it means for the Series C diligence window, and what to do first.

SECTION 01

Summary

The model delivery pipeline is sound at the core and brittle at the edges. Three findings carry most of the risk, and all three are fixable inside one quarter by the team already in place.

The short version. Evaluation is manual, lineage stops at the training set, and nobody owns the rollback decision. An acquirer's counterparts will find all three in the first week.

SECTION 02

Findings

Evaluation

Offline evaluation runs by hand before each release. The harness exists; it is not wired into the promotion gate.

ID	FINDING	SEVERITY	OWNER
F-01	Evaluation is not a promotion gate	High	Platform
F-02	Lineage stops at the training set	High	Data
F-03	No named owner for rollback	Medium	Engineering

Lineage

- Training data is versioned in object storage.
- Feature definitions are not versioned alongside the model.
- Prompt templates live in application code with no release tag.

SECTION 03

Recommendations

01. Wire the existing harness into the promotion gate.
02. Version feature definitions and prompts with the model artifact.
03. Name the rollback owner and write the runbook.

Sequencing

Do the gate first. It makes the other two measurable, and it is the finding a diligence team will test directly. See the [DORA research] (<https://dora.dev>) for the delivery metrics that frame it.
